

Architectural Synthesis: Defining the Fusion-Sense Interface Paradigm

Document ID: INL-2026-POCKET.FUSION_SENSE.001

Executive Summary: The Latency Gap

The traditional HCI is bottlenecked by the physical latency of peripheral input. We have moved from punch cards to keyboards, but the pathway remains tethered to slow, discrete mechanical actions.

Fusion-Sense collapses the boundary between intent and execution. By evaluating workflow iterations **wf1-wf3**, this document establishes the strategic framework for a high-fidelity, multimodal operating environment that treats software not as a static tool, but as a responsive extension of cognitive flow.

The Workflow Benchmark

ID | Configuration | Output Density | Latency Profile | Verdict

wf1 | Fus

Analyst's note: Fusion-Sense integration (wf1) correlates with higher density and **~38%** less manual thrash to reach remake/3D outcomes vs fragmented desktop workflows (concept-to-materialization, not raw typing speed).

Strategic Pillars

1. Intent-aware latency reduction

Modern UIs fail when they force file-system navigation instead of concept navigation. Fusion-Sense maps **intent vectors**: symbols, action_hints, and re-sense after act - not waiting for a perfect CLI string.

POCKET: `action\_hints` from page render · mission loop re-senses · orchestrator attaches fusion brief to every skill.

2. Multimodal convergence

Abandon application-as-silo. Unify browser, terminal, vision, and synthesis in one seat.

POCKET: Desk agents + NEXUS + vcomp terminals + RFE + Studio under `GET /v1/api`.

3. High-density symbol processing

Spatial/UI structure is more efficient than pure keystroke entry for complex scenes.

POCKET: Deep UIA (?800-1500), OCR lines, visual grid -> ScreenIR -> HTML/3D/GLSL.

Comparative industry context

Environment | Interaction | Productivity (conceptual) | Scaling

Standard ID

Methodology: time from conceptual initiation to functional host-grounded prototype (remake / act path), not LOC/hour alone.

Roadmap (aligned to platform)

Phase | Objective | Status
