

Imagine Studio, Viral Software Demos, and Fusion Remake

Research Report for the POCKET Platform (Not In-App Copy)

Document ID: INL-2026-POCKET.IMAGINE.VIRAL.001

Lab: ItsN

0. Why this paper exists

POCKET already captures the host (SPECULUM), understands the screen (OCULUS fusion: UIA + OCR + pure visual), and can export "viral" clips. Early exports were **flat phone silhouettes** with a **destructive crop** of a desktop recording. That is not what people mean when they say:

"We made this in one prompt."

What they mean is a **composition system** that looks like the demos flooding X right now: real UI clarity, motion that teaches, and (when needed) a **3D device** that holds a **correct** screen - not a stretched mess inside a 2D rectangle.

This report is the research backbone for:

1. **Viral demo styles that actually work on X** (taxonomy + craft rules).

2. **Imagine**

1. What "viral software demos on X" actually are

1.1 Two families (do not mix them up)

Family | What you see | Examples (public craft) | Core rule

A. Screenca
Content is kin

Family A is what most **Claude / Grok / Cursor** product posts look like: cursor moves, UI reacts, captions hit hard, 15-45 seconds.

Family B is what **app marketers** use: dark studio gradient, soft shadow, slight tilt / orbit, glass reflections, correct phone proportions.

Failure mode we hit before: using Family B **shape** with Family A **source** and a **cover-crop** that destroys the UI. That is why "the screen shape was fine but the inside made no sense."

1.2 Craft rules (portable checklist)

1. **Hook in 2 seconds** - one claim or one surprising UI move.

2. **Show, d**

1.3 Tools people use (industry baseline)

- **Screen Studio** - auto-zoom, cursor polish, Mac device framing.

- **Rotato /

Platform implication: POCKET must own **capture -> understand -> compose -> export** as one API, not "export a bezel PNG."

2. Inventory: which of *your* builds becomes Imagine Studio

We scanned OneDrive / Documents / Desktop / organism-ai / AIEOSpro.

2.1 Best seed: Creative Muse (organism-ai)

Path: `C:\Users\Medin\OneDrive\organism-ai\creative-muse.zip`

Seeded in

What it already models:

- Image engines catalog (Stable Diffusion / DALL-E style slots)

- Music eng

It is **not** yet a full layered photo editor - but it is the right *creative orchestration* brain for Imagine Studio.

2.2 Related but different products (do not force into POCKET UI)

Build | Path | Role

Sovereign Fo

2.3 Product split (so we do not bloat one window)

POCKET (host co-pilot API)

· OCULUS

Imagine Studio (full image + media studio product)

· Layers, m

Doctrine: Imagine Studio is a **first-class product folder + API surface**, referenced by POCKET - not a pile of buttons dumped into the desk UI.

3. Why flat phone frames fail (and how real 3D mockups work)

3.1 What we did wrong

1. Crop desktop landscape **to fill** 9:16 (`force\_original\_aspect\_ratio=increase` + center crop).

2. Draw a **

Result: wrong content, wrong scale, no depth, no studio lighting. Not viral - just branded crop.

3.2 What Rotato-class pipelines do

1. **Content stage:** screenshot or video kept **readable** (contain / letterbox into glass).

2. **Device

3.3 What Screencast-polish pipelines do (no phone)

1. Full product window or clean region capture.

2. Auto-zoom

POCKET must support **both** as named presets, not one broken hybrid.

4. Fusion modeling -> remake -> 3D / video

4.1 What fusion already gives us

From page render / understand:

- **UIA symbols** - kind, text, bbox, click, automation_id, invocable

- **OCR lin

This is a **scene graph of the glass**, not a JPEG.

4.2 Intermediate Representation (IR) for remake

ScreenIR

size: [W,H]

Remake levels:

Level | Output | Use

L0 Observe |

4.3 Research anchors (public literature)

- **Screen Parsing** (Wu et al.) - reverse engineer UI structure from pixels.

- **UI2Code**
optimization

POCKET edge: we are not screenshot-only. We fuse **OS accessibility truth** with OCR and visual structure. Normal chat models get a picture; we get a **host-grounded symbol graph** with click targets.

4.4 3D step (practical, local)

Without shipping Blender by default:

1. Map UI plane to a textured rectangle in a simple scene (Pillow composite + perspective).

2. Optional:

Agents call: ``POST /v1/fusion/remake`` then ``POST /v1/studio/render`` with preset ``rotato_phone`` / ``x_screencast``.

5. Imagine Studio product definition

5.1 Jobs to be done

1. Generate / edit stills (prompt + layers + masks).

2. Rebuild UI

5.2 Module map

imagine-studio/

seed-creator

pocket-os/src/pocket/

imagine_studio

5.3 API surface (unified)

GET /v1/api # master catalog

GET /v1/vis

6. Platform doctrine: do not get lost in micros

6.1 The failure pattern

Ship a clever micro (flat bezel, extra button) -> demo it once -> never wire agents -> never update catalog -> user cannot tell POCKET from "paste a screenshot into Claude."

6.2 The rule

Every deliverable must update **all** of:

1. **Core module** (real code)

2. **HTTP r**

6.3 Differentiation vs "normal Claude / normal Grok"

Capability | Chat-only LLM | POCKET host platform

See live UI wi

7. Implementation plan (executed alongside this paper)

Phase A - Truth in viral export (now)

- New presets: `rotato\_phone`, `x\_screencast`, `macbook\_web`

- Content *

Phase B - Fusion remake (now)

- `fusion\_remake.py`: symbols -> IR -> HTML remake + scene JSON

- API + skil

Phase C - Imagine Studio product home (now)

- Repo: `OneDrive\imagine-studio` with Creative Muse seed

- Runtime l

Phase D - Next (not blocking)

- True glTF / Three.js orbit previews

- Auto-zoom

8. Evaluation criteria (what "good" means)

1. **Readable glass:** body text on screen remains legible after mockup.

2. **Device**

9. File map (where everything lives)

REMAKE.md`

10. Closing

Viral demos are not "draw a phone." They are ****composition + truth****.

Imagine Stu

Update the platform every time - or it is just another script someone can replace with a chat window.

End of report. ItsNotAI Labs / Medina Tech Labs - 2026.
